

Therapeutic Listening®

Therapeutic Listening® is a sound-based program that utilizes both ears to engage the entire body to support organization of the central nervous system. As the child listens, he or she may be very active working on challenging postural organization, motor planning or higher level sensory integration skills.

A certified therapist creates an individual Therapeutic Listening® program that is in place two to six months and may be carried out at home or in the classroom. Call Pediatric Therapy Partners for a consultation to identify the benefits of sound stimulation to:

- Improve modulation disorders such as disturbances in sleep-wake cycle, hunger thirst patterns, bowel/bladder and other homeostatic functions
- Correct poor jaw stability by strengthening muscles connected to ear/jaw that help with chewing
- Increase fine motor function, higher-level selectivity, discrimination and attention
- Strengthen postural stability, balance and midline organization deficits
- Works for children with a history of chronic middle ear pathology/fluid
- Improve poor spatial awareness
